Email: The cloud can improve security by isolating corporate email, a primary entry point for malware and other cyber-threats. Email attachments can be put into an isolated file system to prevent exposing other internal file systems to malware.

On demand testing: The cloud improves the agility of an organization to test new technologies with alternative hardware configurations in minutes, which is not possible in most on-premises data centers.

Isolated production environments: Security and stability of production environments can be significantly improved by removing all contact with non-production applications and users.
